## 74ALVCH16600 18-bit universal bus transceiver (3-State)

## FEATURES

- Complies with JEDEC standard no. 8-1A.
- CMOS low power consumption
- Direct interface with TTL levels
- Current drive $\pm 24 \mathrm{~mA}$ at 3.0 V
- All inputs have bus hold circuitry
- Output drive capability $50 \Omega$ transmission lines @ $85^{\circ} \mathrm{C}$
- MULTIBYTE ${ }^{\text {TM }}$ flow-through standard pin-out architecture
- Low inductance multiple $\mathrm{V}_{\mathrm{CC}}$ and ground pins for minimum noise and ground bounce

## DESCRIPTION

The 74ALVCH16600 is an 18 -bit universal transceiver featuring non-inverting 3 -State bus compatible outputs in both send and receive directions. Data flow in each direction is controlled by output enable ( $\mathrm{OE}_{\mathrm{AB}}$ and $\mathrm{OE}_{\mathrm{BA}}$ ), latch enable ( $\mathrm{LE} \mathrm{E}_{\mathrm{AB}}$ and $\mathrm{LE} \mathrm{E}_{\mathrm{BA}}$ ), and clock $\left(\overline{\mathrm{CP}}_{\mathrm{AB}}\right.$ and $\left.\mathrm{CP}_{\mathrm{BA}}\right)$ inputs. For A -to- B data flow, the device operates in the transparent mode when $L E_{A B}$ is High. When $L E_{A B}$ is Low, the $A$ data is latched if $\mathrm{CP}_{\mathrm{AB}}$ is held at a High or Low logic level. If $\mathrm{LE} \mathrm{E}_{\mathrm{AB}}$ is Low, the A-bus data is stored in the latch/flip-flop on the High-to-Low transition of $\mathrm{CP}_{\mathrm{AB}}$. When $\mathrm{OE}_{\mathrm{AB}}$ is Low, the outputs are active. When $\overline{O E}_{\mathrm{AB}}$ is High, the outputs are in the high-impedance state. The High clock can be controlled with the clock-enable inputs ( $C E_{B A} / \mathrm{CE}_{\mathrm{AB}}$ ).

Data flow for B-to-A is similar to that of A-to-B but uses $\overline{O E}_{B A}, L E_{B A}$ and $\mathrm{CP}_{\mathrm{BA}}$.

To ensure the high impedance state during power up or power down, $\mathrm{OE}_{\mathrm{BA}}$ and $\mathrm{OE}_{\mathrm{AB}}$ should be tied to $\mathrm{V}_{\mathrm{CC}}$ through a pullup resistor; the minimum value of the resistor is determined by the current-sinking/current-sourcing capability of the driver.
Active bus hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

$P_{D}=C_{P D} \times V_{C C}^{2} \times f_{i}+\Sigma\left(C_{L} \times V_{C C}^{2} \times f_{0}\right)$ where:
$\mathrm{f}_{\mathrm{i}}=$ input frequency in $\mathrm{MHz} ; \mathrm{C}_{\mathrm{L}}=$ output load capacitance in pF ;
$\mathrm{f}_{\mathrm{O}}=$ output frequency in MHz; $\mathrm{V}_{\mathrm{CC}}=$ supply voltage in V ;
$\Sigma\left(C_{L} \times V_{C C}{ }^{2} \times f_{0}\right)=$ sum of outputs.
